Anaphylaxis and Allergy in the Emergency Department

Up to 30% of people are affected by some kind of allergy.\textsuperscript{1} Anaphylaxis is a serious allergic reaction that is rapid in onset and may cause death.\textsuperscript{2} Anaphylaxis symptoms can range from mild to severe and typically involve at least 2 body systems (e.g., respiratory, cardiovascular). This information is intended to build awareness and support policy development around anaphylaxis and severe allergy.

Each year, 1% of all emergency department (ED) visits are for an allergic reaction (including anaphylaxis). 8% of these visits are for anaphylaxis specifically.

Emergency treatment

Canadian allergists’ recommendations include the following if you suspect an anaphylactic reaction:\textsuperscript{3}

- Give epinephrine auto-injector.
- Call 9-1-1.
- Go to the nearest hospital.

Note

Includes Ontario and Alberta.

Sources

- In Ontario and Alberta alone, there were more than 85,400 ED visits for an allergic reaction (including anaphylaxis) in 2013–2014.
- Extrapolating to all of Canada means there would have been more than 171,000 visits to the ED for allergy that year.
• Children younger than 18 made up 1 in 3 patients coming to the ED for allergic reactions, compared with 1 in 5 for all other reasons.
• Most allergic reactions were classified as “Unspecified” (69%). Insect/snake bites accounted for 15% of visits; 11% of visits were food related and 5% were drug related.

People more often go to the ED for allergic reactions in the summer; visits for food-related reactions are also common in December.

Table 1: Percentage of visits to the ED for allergic reaction (including anaphylaxis), by category and month, 2013–2014

The rate of visits specifically for anaphylaxis represents a small but growing portion, increasing by 95% per 100,000 population between 2006–2007 and 2013–2014.

Since 2006–2007, there has been a 64% increase in the rate of individuals dispensed an epinephrine auto-injector. Total spending on epinephrine auto-injectors is also rising, increasing 28% in the last 3 years. In comparison, spending for all other drugs rose only 10%, according to data from IMS Brogan.
